

## The Portland Group selected by Linux magazine as one of the top 20 companies to watch in 2007

*by Bend Weekly News Sources*

The Portland Group(TM) (PGI), a wholly-owned subsidiary of STMicroelectronics and the leading independent supplier of compilers and tools for high-performance computing, today announced that it has been named one of the Top 20 Companies to Watch in 2007 by Linux Magazine. The Linux Magazine "20 Companies to Watch in 2007" list features vendors that are best positioned in the coming year to spur Linux and Open Source adoption while delivering on the immediate needs of the marketplace.

The Portland Group, a wholly-owned subsidiary of STMicroelectronics, is the premier supplier of high-performance Fortran, C, and C++ compilers and tools for high-end computing systems and for workstations, servers, and clusters based on 64-bit x64 and 32-bit x86 processors. Further information on The Portland Group products can be found at [www.pgroup.com](http://www.pgroup.com), by calling Sales at (503) 682-2806, or by email to [sales@pgroup.com](mailto:sales@pgroup.com). "The Portland Group is meeting the challenge of processor complexity and the growing need for high-performance parallel software head on. The next-generation of software development is on the horizon and PGI is well-positioned to enable it," said Bryan Richard, editorial director, Linux Magazine.

PGI compilers and tools are widely used in high-performance technical computing (HPTC) and other application areas that require parallelization and optimization capabilities to extract maximum performance from the latest multi-core processors from AMD and Intel. The compilers and tools from PGI deliver a complete, uniform, optimizing, parallel C/C++ and Fortran application development environment across 32-bit and 64-bit systems based on either AMD or Intel multi-core processors running either the Linux or Windows operating systems.

"It's quite an honor for The Portland Group to be nominated to the list of top 20 companies to watch by Linux Magazine," said Douglas Miles, director, The Portland Group. "While PGI has been delivering production-quality parallel compilers and development tools for Linux since 1997, the mainstreaming of clustering and multi-core processors in the past year has really put a focus on the importance of these capabilities."
