

High-tech tool for ROP in premature babies

by Bob Kast

What is ROP?

Retinopathy of prematurity is a potentially blinding eye disorder that primarily affects premature infants. Thousands of children worldwide lose vision permanently because of diseases and injuries of the retina.

What is RETCAM II?

It is a mobile, self-contained system consisting of a fiber-optic camera, computer with special software and color monitor. It is used to screen for disorders of the retina in children.
